„The MSc (CE) Orthodontics provides the knowledge, skills and abilities for comprehensive orthodontic treatment.“

DIRECTOR OF THE ACADEMIC PROGRAM:

Univ.-Prof. Dr. Dr. Dieter Müssig

Rector and Director of the Centre for Orthodontics at Danube Private University

The exceptional quality of the university's programmes is exemplified by the success of the Master of Science in Orthodontics (Continuing Education), MSc (CE). This is proven by the numerous international students from almost 66 nations, including the USA, South Africa, United Arab Emirates and New Zealand.

In addition to the treatment of children and adolescents, which is still predominantly practised in orthodontics, the periodontal, functional, pre-prosthetic and aesthetic treatment of adults is a wide field of practice. New treatment techniques and methods that meet the needs of orthodontic adult treatment are taught in detail and in a practical manner. This makes orthodontics a treatment method that crosses generations. The digital workflow in orthodontics and other innovative applicationtechniques are integrated throughout the state-of-the-art curriculum.

Specialize in a field of dentistry
with a Master of Science (CE) degree programme at the Danube Private University (DPU) in Krems. Study in English with an international group of dentists seeking to implement the very latest developments. Experience all this while also getting to know the culture and nature of Austria.

Enhance your knowledge
with one of the most sought-after specializations in dentistry – the Master of Science (CE) in Orthodontics, at a place where tradition and future coexist, in an international community of dentists who run the best dental practices in the world.

„Implantology and oral surgery are two important elements of dental, oral and maxillofacial medicine, and in their view they undoubtedly support and complement each other.“

DIRECTOR OF THE ACADEMIC PROGRAM:

Univ.-Prof. Dr. Dr. Ralf Gutwald

Dean and Coordinator of Scientific Continuing Education and Postgraduate Studies at DPU

Implantology is one of the major growth areas.
No other area has developed as strongly in recent years from a diagnostic, therapeutic and scientific perspective.
Other factors such as demographic development, the multimorbidity of older patients and the constantly changing spectrum of medicine with new treatment options also place new and ever higher demands on surgical treatment.
Nor should the needs of the patient be forgotten. The majority of patients still want holistic treatment from their family dentist, despite the general trend towards specialisation.
It should therefore be a matter of course for the practice of today to successfully offer implantology and oral surgery.

Anyone who has ever dealt with implantology and oral surgery wants to expand their intellectual and manual range of skills. Dentists should not immediately push themselves to their limits, but rather undertake to a well-founded scientific learning process. The transfer of secure concepts and alternatives, combined with manual skills, should enable dentists to meet the demands of successful implantation and surgery even in difficult situations and to intervene confidently in the event of complications.
This programme meets the contemporary and increased surgical requirements.
You, too, can meet the expectations of a modern society and qualify yourself for the future.
